## Planar straight-line drawings

### Theorem. [De Fraysseix, Pach, Pollack '90]

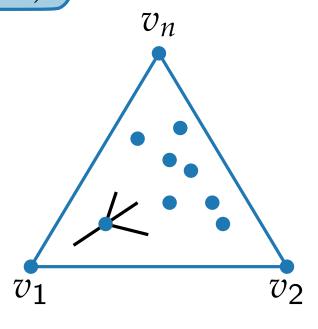

Every n-vertex planar graph has a planar straight-line drawing of size  $(2n-4)\times(n-2)$ .

**Theorem.** [Schnyder '90] Every n-vertex planar graph has a planar straight-line drawing of size  $(n-2) \times (n-2)$ .

 $(2n-5) \times (2n-5)$ 

#### Idea.

- Fix outer triangle.
- Compute coordinates of inner vertices
  - based on outer triangle
  - and how much space there has to be for other vertices
- using barycentric coordinates.

(0, 1, 0)

(0, 0, 1)

## Barycentric coordinates

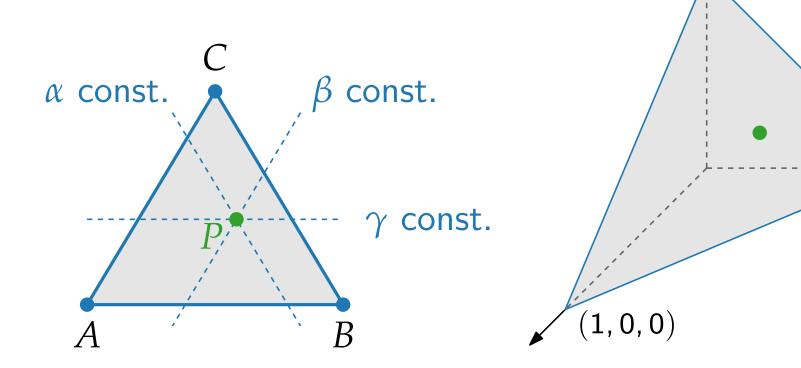

#### Definition.

Let  $A, B, C, P \in \mathbb{R}^2$ .

The barycentric coordinates of P with respect to  $\triangle ABC$  are a triple  $(\alpha, \beta, \gamma) \in \mathbb{R}^3_{>0}$  such that

$$\alpha + \beta + \gamma = 1$$

$$P = \alpha A + \beta B + \gamma C.$$

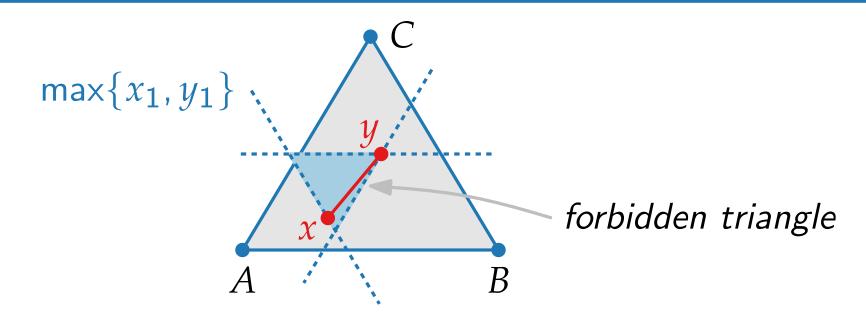

## Barycentric representation

#### Definition.

A barycentric representation of a graph G=(V,E) is an assignment of barycentric coordinates to the vertices of G; i.e. it is *injective* map  $\phi\colon V\to\mathbb{R}^3_{\geq 0},\ v\mapsto (v_1,v_2,v_3)$  with the following properties:

- $v_1 + v_2 + v_3 = 1$  for all  $v \in V$
- for each  $\{x,y\} \in E$  and each  $z \in V \setminus \{x,y\}$  there exists  $k \in \{1,2,3\}$  with  $x_k < z_k$  and  $y_k < z_k$ .

# Barycentric representations & planar graphs

#### Lemma.

Let  $\phi: v \mapsto (v_1, v_2, v_3)$  be a barycentric representation of a graph G = (V, E) and let  $A, B, C \in \mathbb{R}^2$  in general position. Then the mapping

$$f \colon v \in V \mapsto v_1 A + v_2 B + v_3 C$$

gives a planar drawing of G inside  $\triangle ABC$ .

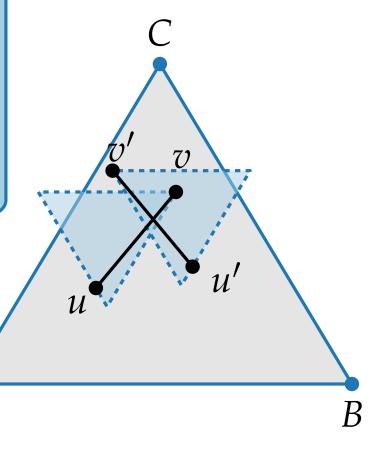

- **Proof.** No vertices occur "inside" an edge
- No pair of edges  $\{u, v\}$  and  $\{u', v'\}$  cross:

$$u'_{i} > u_{i}, v_{i} \quad v'_{j} > u_{j}, v_{j} \quad u_{k} > u'_{k}, v'_{k} \quad v_{l} > u'_{l}, v'_{l}$$

$$\Rightarrow \{i, j\} \cap \{k, l\} = \emptyset$$

wlog  $i = j = 1 \Rightarrow u'_1, v'_1 > u_1, v_1 \Rightarrow$  separated by straight line

How to get vertices on grid?

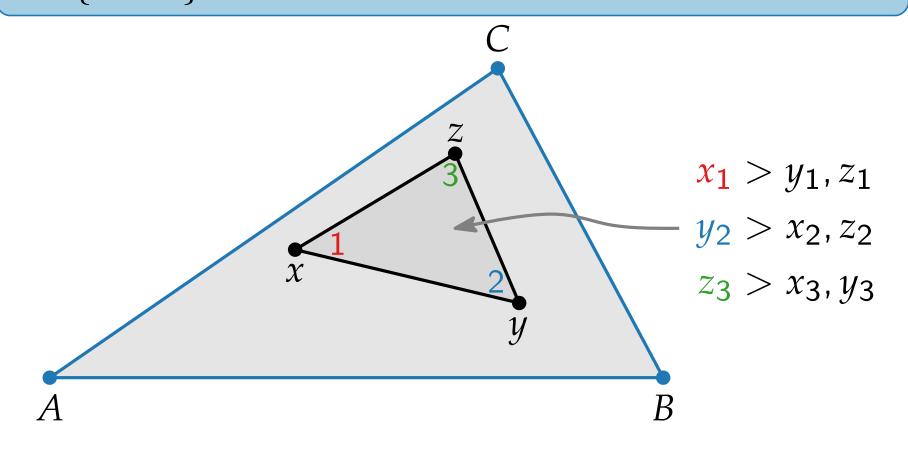

## Angle labeling

### **Observation**

Let  $v \mapsto (v_1, v_2, v_3)$  be a barycentric representation of a triangulated plane graph G = (V, E).

We can **uniquely** label each angle  $\angle(xy, xz)$  with  $k \in \{1, 2, 3\}$ .

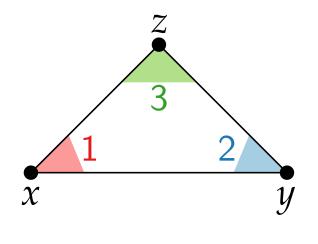

# Schnyder labeling

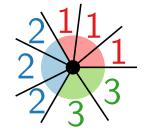

### Definition.

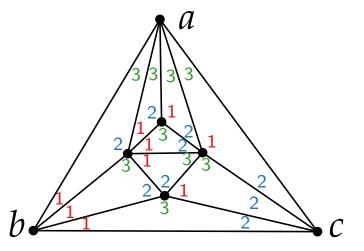

A **Schnyder labeling** (normal labeling) of a triangulated plane graph G is a labeling of all internal angles with labels 1, 2 and 3 such that:

Faces Each internal face contain vertices with all three labels 1, 2 and 3 appearing in a counterclockwise order.

**Vertices** The ccw order of labels around each vertex consists of a nonempty interval of 1's followed by a nonempty interval of 2's followed by a nonempty interval of 3's.

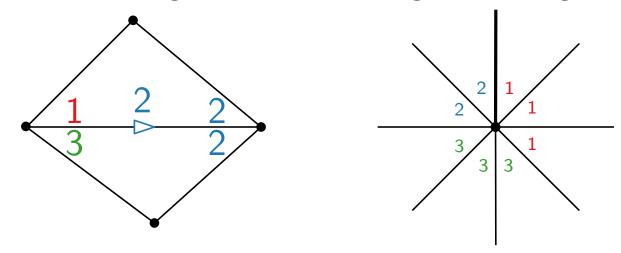

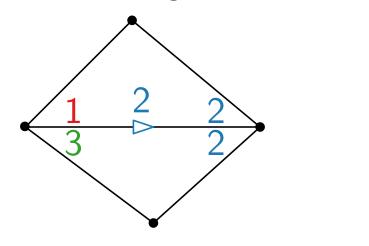

# Schnyder realiser

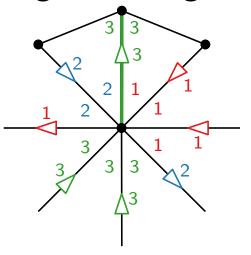

Schnyder labeling induces an edge labeling

# Schnyder realiser

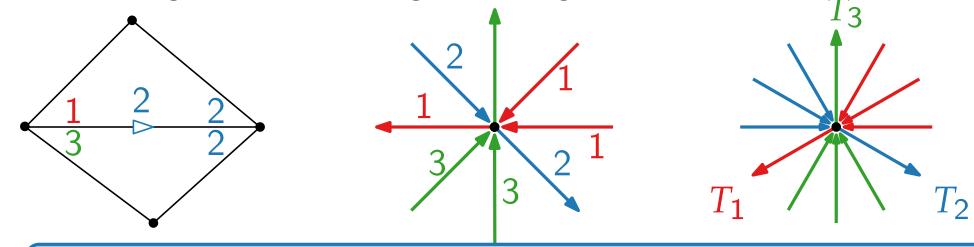

Schnyder labeling induces an edge labeling

# Schnyder realiser

Schnyder labeling induces an edge labeling

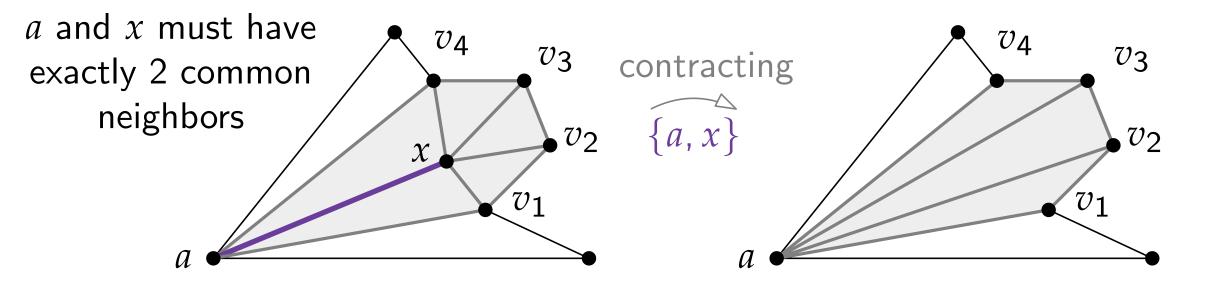

#### Definition.

A **Schnyder forest** or **realiser** of a triangulated plane graph G = (V, E) is a partition of the inner edges of E into three sets of oriented edges  $T_1$ ,  $T_2$ ,  $T_3$  such that for each inner vertex  $v \in V$  holds:

- lacksquare v has one outgoing edge in each of  $T_1$ ,  $T_2$ , and  $T_3$ .
- The ccw order of edges around v is: leaving in  $T_1$ , entering in  $T_3$ , leaving in  $T_2$ , entering in  $T_1$ , leaving in  $T_3$ , entering in  $T_2$ .

### Lemma. [Kampen 1976]

Let G be a triangulated plane graph with vertices a, b, c on the outer face. There exists a **contractible edge**  $\{a, x\}$  in G,  $x \neq b$ , c.

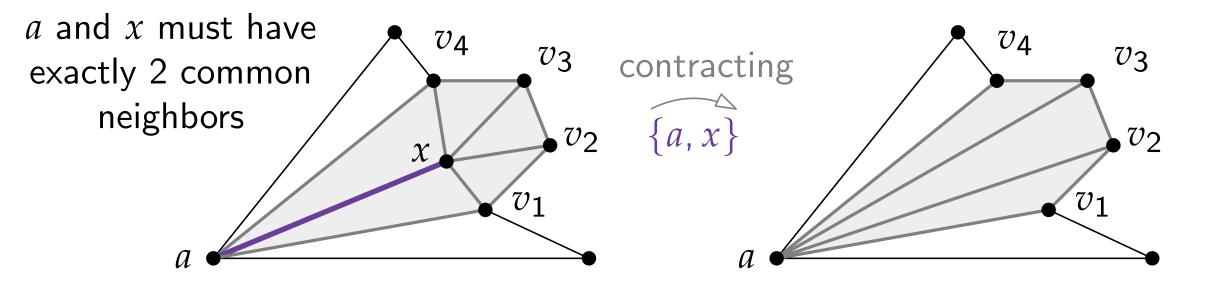

### Lemma. [Kampen 1976]

Let G be a triangulated plane graph with vertices a, b, c on the outer face. There exists a **contractible edge**  $\{a, x\}$  in G,  $x \neq b$ , c.

#### Theorem.

Every triangulated plane graph has a Schnyder labeling.

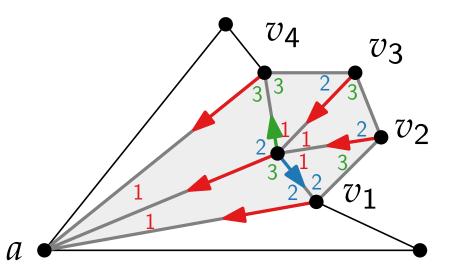

### Lemma. [Kampen 1976]

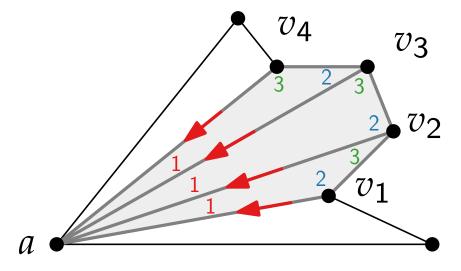

Let G be a triangulated plane graph with vertices a, b, c on the outer face. There exists a **contractible edge**  $\{a, x\}$  in G,  $x \neq b$ , c.

#### Theorem.

Every triangulated plane graph has a Schnyder labeling.

**Proof** by induction on # vertices via edge contractions.

### Lemma. [Kampen 1976]

Let G be a triangulated plane graph with vertices a, b, c on the outer face. There exists a **contractible edge**  $\{a, x\}$  in G,  $x \neq b$ , c.

#### Theorem.

Every triangulated plane graph has a Schnyder labeling.

Proof also gives an algorithm to produce a Schnyder labeling. It can be implemented in  $\mathcal{O}(n)$  time . . . as exercise.

### Lemma. [Kampen 1976]

Let G be a triangulated plane graph with vertices a, b, c on the outer face. There exists a **contractible edge**  $\{a, x\}$  in G,  $x \neq b$ , c.

#### Theorem.

Every triangulated plane graph has a Schnyder labeling.

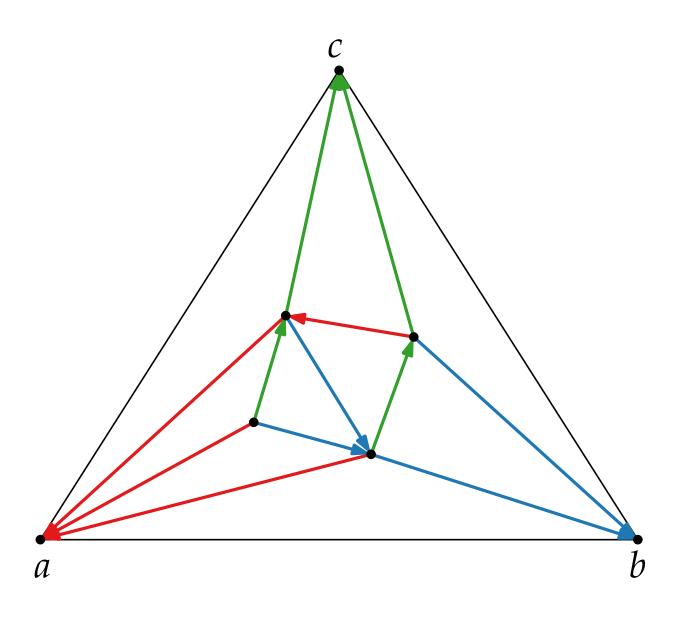

Proof also gives an algorithm to produce a Schnyder labeling. It can be implemented in  $\mathcal{O}(n)$  time . . . as exercise.

Theorem and previous construction imply:

### Corollary.

Every triangulated plane graph has a Schnyder realiser.

## Schnyder realiser – properties

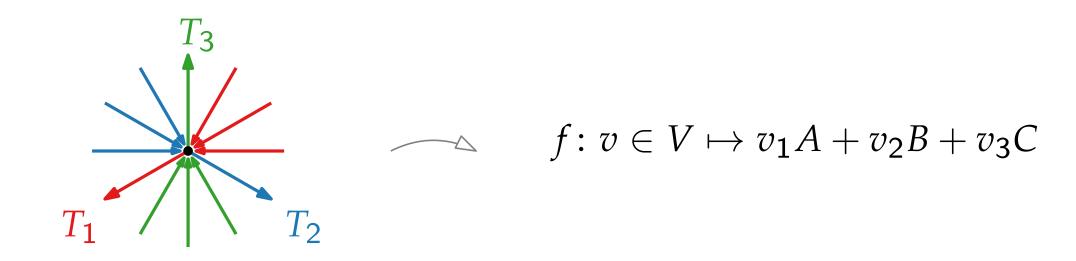

- For each v there exists a directed red, blue, green path from v to a, b, c, respectively.
- No monochromatix cycle exists
- Each monochromatic subgraph is a tree!
- The sinks of red/blue/green trees are the vertices *a*, *b*, *c*.

This is ensured by construction via contraction operation.

(Bonus: Can construct all valid Schnyder realiser.)

# Schnyder drawing

How to get from Schnyder realiser to barycentric representation

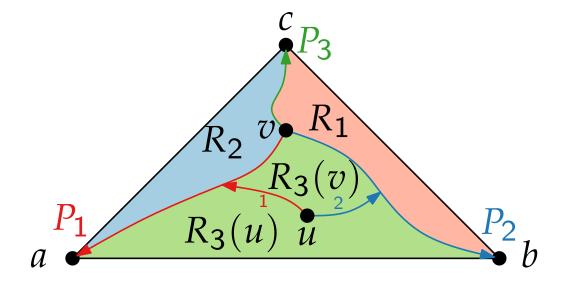

### Face regions

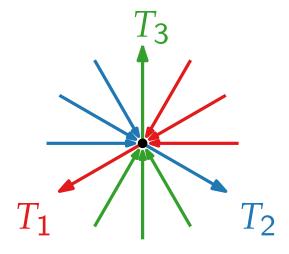

- $\blacksquare$   $P_i(v)$  path from v to source of  $T_i$
- $\blacksquare$   $R_1(v)$ ,  $R_2(v)$ ,  $R_3(v)$  are sets of faces

#### Lemma.

- Paths  $P_1(v)$ ,  $P_2(v)$ ,  $P_3(v)$  cross only at vertex v.
- For inner vertices  $u \neq v$  it holds that  $u \in R_i(v) \Rightarrow R_i(u) \subsetneq R_i(v)$ .

**Proof** ...

# Schnyder drawing

Let barycentric coordinates of  $v \in G \setminus \{a, b, c\}$ be  $(v_1, v_2, v_3)$ , where  $v_1 = |R_1(v)|/(2n-5)$ ,  $v_2 = |R_2(v)|/(2n-5)$  and  $v_3 = |R_3(v)|/(2n-5)$ .

#### Theorem.

The mapping

$$f: v \mapsto (v_1, v_2, v_3) = \frac{1}{2n-5}(|R_1(v)|, |R_2(v)|, |R_3(v)|)$$

is a barycentric representation of G, which thus gives a planar straight-line drawing of G in a  $(2n-5)\times(2n-5)$  grid.

### **Proof.** Condition 1: $v_1 + v_2 + v_3 = 1$

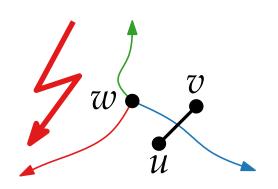

Condition 2: For each edge 
$$\{u,v\}$$
 and vertex  $w \neq u,v$  at least one of three is true:  $w_1 > u_1, v_1, w_2 > u_2, v_2, w_3 > u_3, v_3$ .

#### Set

$$A = (2n - 5, 0)$$

$$B = (0, 2n - 5)$$

$$C = (0, 0)$$

## Weak barycentric representation

#### Definition.

A weak barycentric representation of a graph G = (V, E) is an *injective* map  $v \in V \mapsto (v_1, v_2, v_3) \in \mathbb{R}^3$  with the following properties:

- $v_1 + v_2 + v_3 = 1$  for every  $v \in V$
- for every  $\{x,y\} \in E$  and every  $z \in V \setminus \{x,y\}$  there is  $k \in \{1,2,3\}$  with  $(x_k, x_{k+1}) <_{lex} (z_k, z_{k+1})$  and  $(y_k, y_{k+1}) <_{lex} (z_k, z_{k+1})$ .

i.e., either  $y_k < z_k$  or  $y_k = z_k$  and  $y_{k+1} < z_{k+1}$ 

### Weak barycentric representation

#### Definition.

A weak barycentric representation of a graph G = (V, E) is an *injective* map  $v \in V \mapsto (v_1, v_2, v_3) \in \mathbb{R}^3$  with the following properties:

- $v_1 + v_2 + v_3 = 1$  for every  $v \in V$
- for every  $\{x,y\} \in E$  and every  $z \in V \setminus \{x,y\}$  there is  $k \in \{1,2,3\}$  with  $(x_k,x_{k+1}) <_{\text{lex}} (z_k,z_{k+1})$  and  $(y_k,y_{k+1}) <_{\text{lex}} (z_k,z_{k+1})$ .

A weak barycentric representation still provides a planar drawing.

i.e., either  $y_k < z_k$  or  $y_k = z_k$  and  $y_{k+1} < z_{k+1}$ 

Proof is similar to before, and thus an exercise.

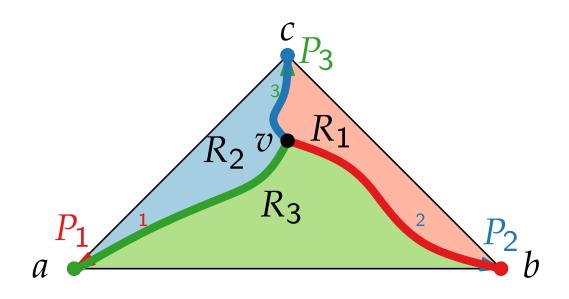

### New barycentric coordinates

- Set  $v_i' = |V(R_i(v))| |P_{i-1}(v)|$
- Additionally, for outer vertices set

$$a_1' = n - 2$$

- $a_2' = 1$
- $a_3^7 = 0$

and analogously for b' and c'

#### Lemma.

For inner vertices  $u \neq v$  it holds that

$$u \in R_i(v) \Rightarrow (u'_i, u'_{i+1}) <_{\mathsf{lex}} (v'_i, v'_{i+1})$$

# Schnyder drawing

#### Theorem.

The mapping

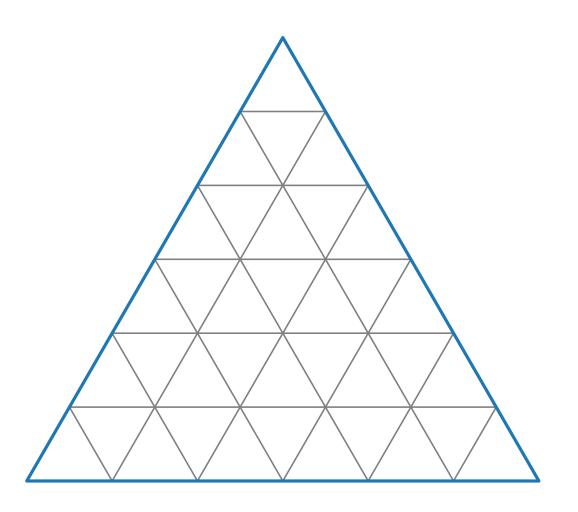

$$f \colon v \mapsto \frac{1}{n-1}(v_1', v_2', v_3')$$

is a weak barycentric representaion of G.

#### Remarks.

- By setting A = (n 1, 0), B = (0, n 1), C = (0, 0), one obtains a planar straight-line drawing of G on an  $(n 2) \times (n 2)$  grid.
- To calculate all the coordinates, a constant number of tree traversals are enough — exercise.
