Part I: Characterization

Jonathan Klawitter

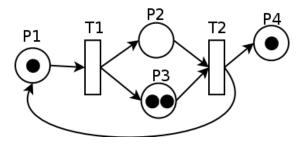

## Upward Planar Drawings – Motivation

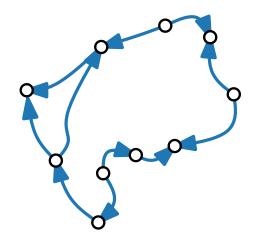

- What may the direction of edges in a digraph represent?
  - Time
  - Flow
  - Hierarchy
- Would be nice to have general direction preserved in drawing.

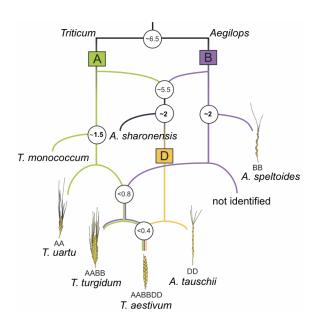

PERT diagram

Petri net

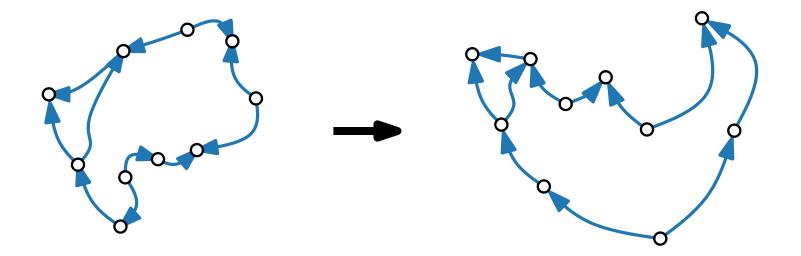

Phylogenetic network

# Upward Planar Drawings – Definition

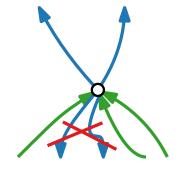

A directed graph G=(V,E) is **upward planar** when it admits a drawing  $\Gamma$  that is

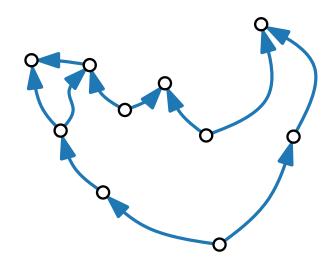

- planar and
- where each edge is drawn as an upward, y-monotone curve.

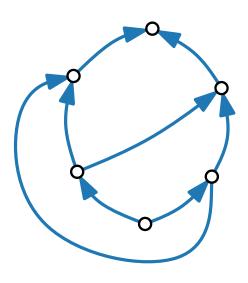

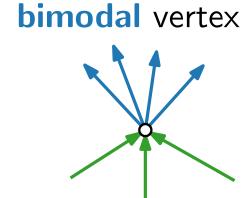

# Upward Planarity – Necessary Conditions

- $\blacksquare$  For a digraph G to be upward planar, it has to be:
  - planar
  - acyclic
  - bimodal
- ... but these conditions are not sufficient.

not bimodal

## Upward Planarity – Characterization

#### **Theorem 1.** [Kelly 1987, Di Battista & Tamassia 1988]

For a digraph G the following statements are equivalent:

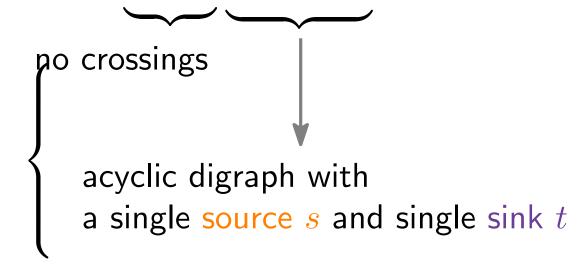

- 1. G is upward planar.
- 2. G admits an upward planar straight-line drawing.
- 3. G is the spanning subgraph of a planar st-digraph.

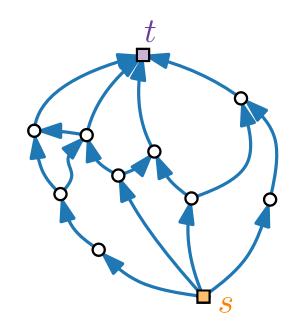

#### Additionally:

Embedded such that s and t are on the outerface  $f_0$ .

or:

Edge (s, t) exists.

# Upward Planarity – Characterization

#### **Theorem 1.** [Kelly 1987, Di Battista & Tamassia 1988]

For a digraph G the following statements are equivalent:

- 1. G is upward planar.
- 2. G admits an upward planar straight-line drawing.
- 3. G is the spanning subgraph of a planar st-digraph.

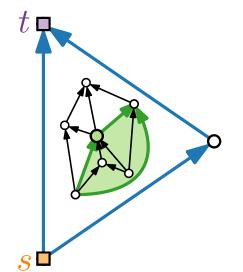

#### Proof.

- $(2) \Rightarrow (1)$  By definition.  $(1) \Leftrightarrow (3)$  Example:
- $(3) \Rightarrow (2)$  Triangulate & construct drawing:

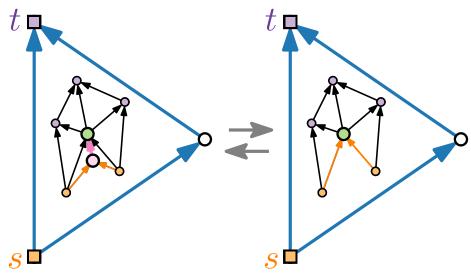

#### Claim.

Case 1: Can draw in chord prespecified triangle.

Induction on n.

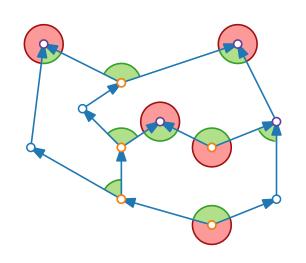

Case 2: no chord

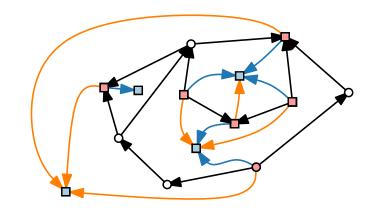

# Visualization of Graphs

# Lecture 6: Upward Planar Drawings

Part II: Assignment Problem

Jonathan Klawitter

# Upward Planarity – Complexity

#### Theorem.

[Garg, Tamassia, 1995]

For a *planar acyclic* digraph it is in general NP-hard to decide whether it is upward planar.

#### Theorem.

[Bertolazzi et al., 1994]

For a combinatorially embedded planar digraph it can be tested in  $\mathcal{O}(n^2)$  time whether it is upward planar.

#### Corollary.

For a *triconnected* planar digraph it can be tested in  $\mathcal{O}(n^2)$  time whether it is upward planar.

#### Theorem.

[Hutton, Libow, 1996]

For a *single-source* acyclic digraph it can be tested in  $\mathcal{O}(n)$  time whether it is upward planar.

#### The Problem

#### Fixed Embedding Upward Planarity Testing.

Let G = (V, E) be a plane digraph with set of faces F and outer face  $f_0$ .

Test whether G is upward planar (wrt to F,  $f_0$ ).

#### Idea.

- $\blacksquare$  Find property that any upward planar drawing of G satisfies.
- Formalise property.
- Find algorithm to test property.

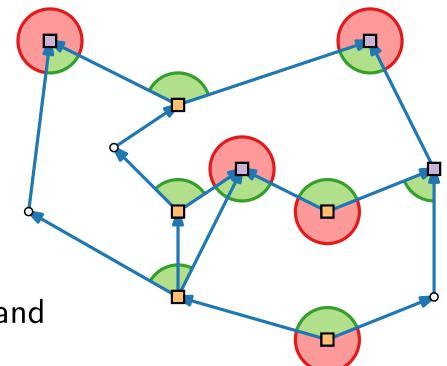

### Angles, Local Sources & Sinks

#### **Definitions.**

- A vertex v is a local source wrt to a face f if v has two outgoing edges on  $\partial f$ .
- A vertex v is a **local sink** wrt to a face f if v has two incoming edges on  $\partial f$ .
- An angle  $\alpha$  at a local source / sink is large when  $\alpha > \pi$  and small otherwise.
- L(v) = # large angles at v
- lacksquare L(f) = # large angles in f
- $\blacksquare S(v) \& S(f)$  for # small angles
- A(f) = # local sources wrt to f= # local sinks wrt to f

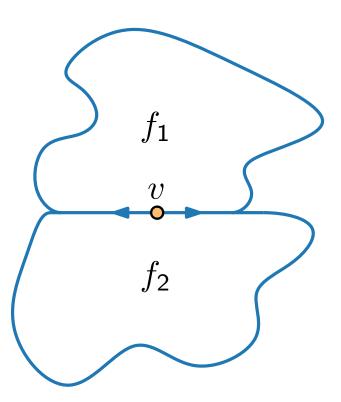

#### Lemma 1.

$$L(f) + S(f) = 2A(f)$$

# Assignment Problem

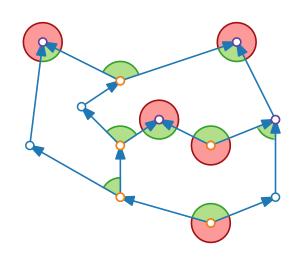

- Vertex v is a global source at faces  $f_1$  and  $f_2$ .
- Does v have a large angle in  $f_1$  or  $f_2$ ?

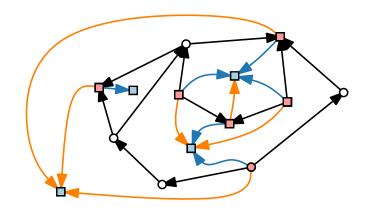

# Visualization of Graphs

# Lecture 6: Upward Planar Drawings

Part III:
Angle Relations

Jonathan Klawitter

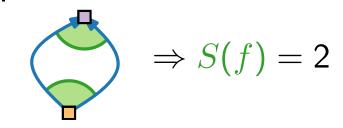

#### Lemma 2.

$$L(f) - S(f) = \begin{cases} -2, & f \neq f_0 \\ +2, & f = f_0 \end{cases}$$

**Proof** by induction.

$$\blacksquare L(f) = 0$$

$$L(f) \geq 1$$

Split f with edge from a large angle at a "low" sink u to

 $\blacksquare$  sink v with small/large angle:

$$f_1$$
  $f_2$   $v$ 

$$L(f) - S(f) = L(f_1) + L(f_2) + 1$$

$$-(S(f_1) + S(f_2) - 1)$$

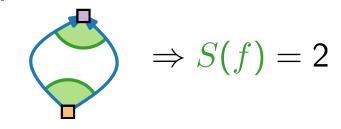

$$= -2$$

#### Lemma 2.

$$L(f) - S(f) = \begin{cases} -2, & f \neq f_0 \\ +2, & f = f_0 \end{cases}$$

**Proof** by induction.

$$L(f)=0$$

$$L(f) \geq 1$$

Split f with edge from a large angle at a "low" sink u to

 $\blacksquare$  sink v with small/large angle:

$$\begin{array}{c|c}
f_1 & f_2 \\
\hline
f_1 & f_2 \\
\hline
u & f_2
\end{array}$$

$$L(f) - S(f) = L(f_1) + L(f_2) + 2$$

$$-(S(f_1) + S(f_2))$$

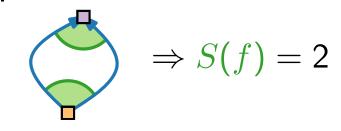

$$= -2$$

#### Lemma 2.

$$L(f) - S(f) = \begin{cases} -2, & f \neq f_0 \\ +2, & f = f_0 \end{cases}$$

**Proof** by induction.

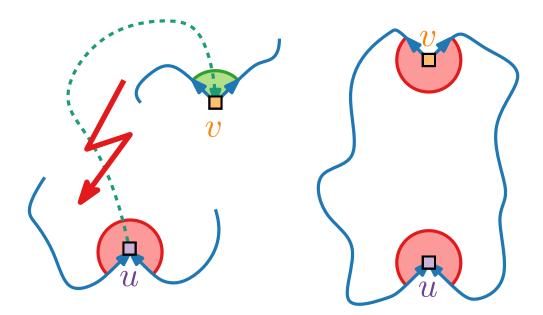

$$L(f) = 0$$

$$\blacksquare$$
  $L(f) \geq 1$ 

Split f with edge from a large angle at a "low" sink u to

 $\blacksquare$  source v with small/large angle:

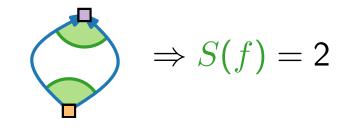

#### Lemma 2.

$$L(f) - S(f) = \begin{cases} -2, & f \neq f_0 \\ +2, & f = f_0 \end{cases}$$

**Proof** by induction.

$$L(f) = 0$$

$$L(f) \geq 1$$

Split f with edge from a large angle at a "low" sink u to

 $\blacksquare$  source v with small/large angle:

$$f_1$$
  $f_2$ 

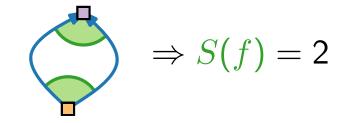

$$L(f) - S(f) = L(f_1) + L(f_2) + 2$$
$$-(S(f_1) + S(f_2))$$
$$= -2$$

#### Lemma 2.

$$L(f) - S(f) = \begin{cases} -2, & f \neq f_0 \\ +2, & f = f_0 \end{cases}$$

**Proof** by induction.

$$L(f) = 0$$

$$\blacksquare$$
  $L(f) \geq 1$ 

Split f with edge from a large angle at a "low" sink u to

vertex v that is neither source nor sink:

$$f_1$$
  $f_2$ 

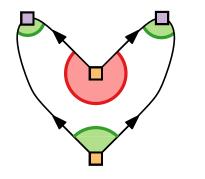

Otherwise "high" source u exists.

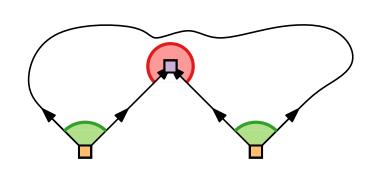

### Number of Large Angles

#### Lemma 3.

In every upward planar drawing of G holds that

- for each vertex  $v \in V$ :  $L(v) = \begin{cases} 0 & v \text{ inner vertex,} \\ 1 & v \text{ source } / \text{ sink;} \end{cases}$
- for each face  $f: L(f) = \begin{cases} A(f) 1 & f \neq f_0, \\ A(f) + 1 & f = f_0. \end{cases}$
- Proof. Lemma 1: L(f) + S(f) = 2A(f)Lemma 2:  $L(f) - S(f) = \pm 2$ .  $\Rightarrow 2L(f) = 2A(f) \pm 2$ .

## Assignment of Large Angles to Faces

Let S and T be the sets of sources and sinks, respectively.

#### Definition.

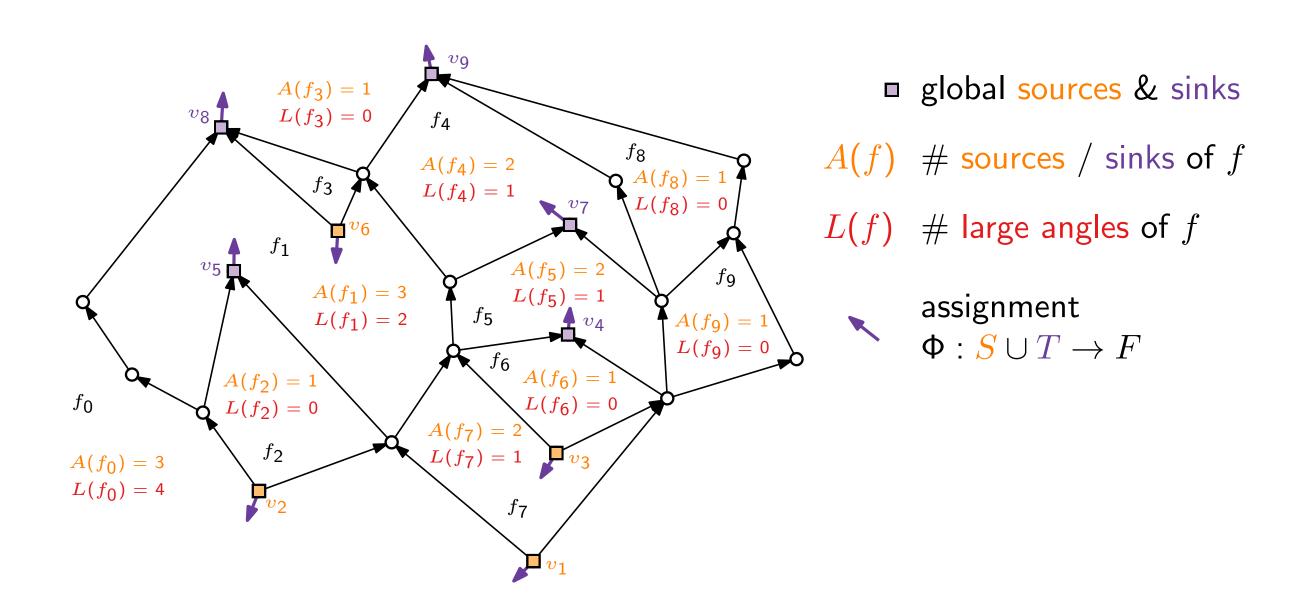

A consistent assignment  $\Phi: S \cup T \to F$  is a mapping where

 $\Phi \colon v \mapsto \text{ incident face, where } v \text{ forms large angle}$ 

such that

$$|\Phi^{-1}(f)| = L(f) = egin{cases} A(f) - 1 & ext{if } f 
eq f_0, \ A(f) + 1 & ext{if } f = f_0. \end{cases}$$

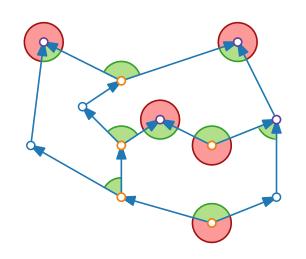

# Example of Angle to Face Assignment

# Lecture 6: Upward Planar Drawings

Part IV: Refinement Algorithm

Jonathan Klawitter

#### Result Characterization

#### Theorem 3.

Let G = (V, E) be an acyclic plane digraph with embedding given by  $F, f_0$ .

Then G is upward planar (respecting F,  $f_0$ ) if and only if G is bimodal and there exists consistent assignment  $\Phi$ .

#### Proof.

 $\Rightarrow$ : As constructed before.

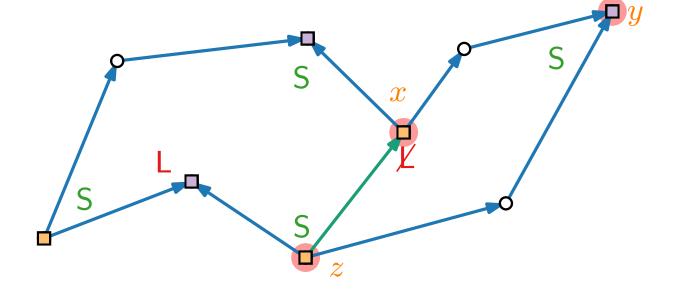

←: Idea:

- $\blacksquare$  Construct planar st-digraph that is supergraph of G.
- Apply equivalence from Theorem 1.

# Refinement Algorithm – $\Phi, F, f_0 \rightarrow \text{st-digraph}$

Let f be a face. Consider the clockwise angle sequence  $\sigma_f$  of L/S on local sources and sinks of f.

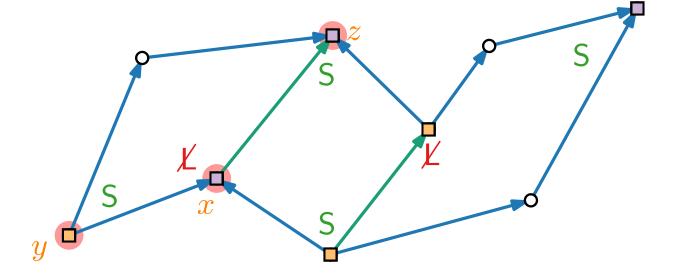

- Goal: Add edges to break large angles (sources and sinks).
- For  $f \neq f_0$  with  $|\sigma_f| \geq 2$  containing  $\langle L, S, S \rangle$  at vertices x, y, z:
- $\blacksquare x \text{ source} \Rightarrow \text{insert edge } (z, x)$

# Refinement Algorithm – $\Phi, F, f_0 \rightarrow \text{st-digraph}$

Let f be a face. Consider the clockwise angle sequence  $\sigma_f$  of L/S on local sources and sinks of f.

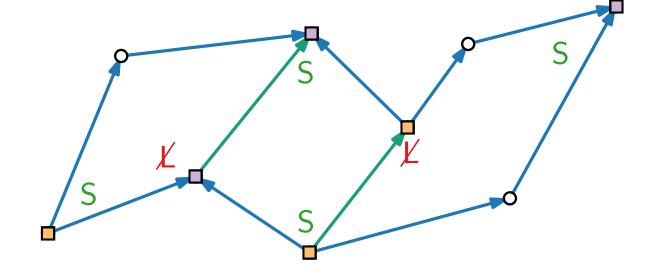

- Goal: Add edges to break large angles (sources and sinks).
- For  $f \neq f_0$  with  $|\sigma_f| \geq 2$  containing  $\langle L, S, S \rangle$  at vertices x, y, z:
- $\blacksquare x \text{ source} \Rightarrow \text{insert edge } (z, x)$
- $\blacksquare x \text{ sink } \Rightarrow \text{insert edge } (x, z).$

# Refinement Algorithm – $\Phi, F, f_0 \rightarrow \text{st-digraph}$

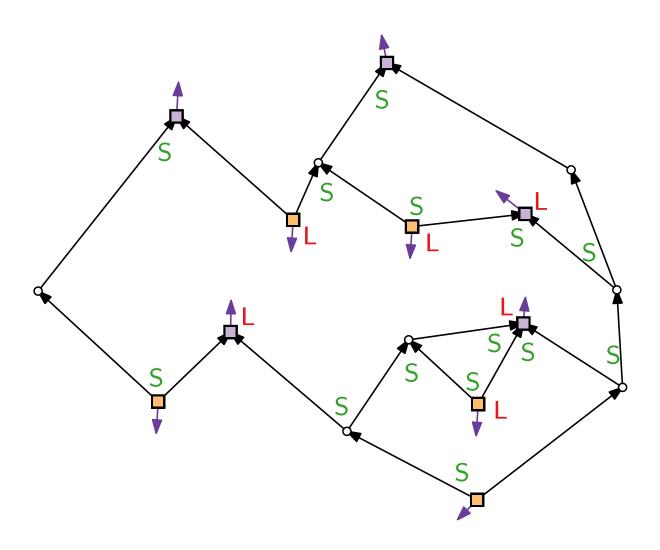

Let f be a face. Consider the clockwise angle sequence  $\sigma_f$  of L/S on local sources and sinks of f.

- Goal: Add edges to break large angles (sources and sinks).
- For  $f \neq f_0$  with  $|\sigma_f| \geq 2$  containing  $\langle L, S, S \rangle$  at vertices x, y, z:
- $\blacksquare x \text{ source} \Rightarrow \text{insert edge } (z, x)$
- $\blacksquare x \text{ sink } \Rightarrow \text{insert edge } (x, z).$
- Refine outer face  $f_0$ .

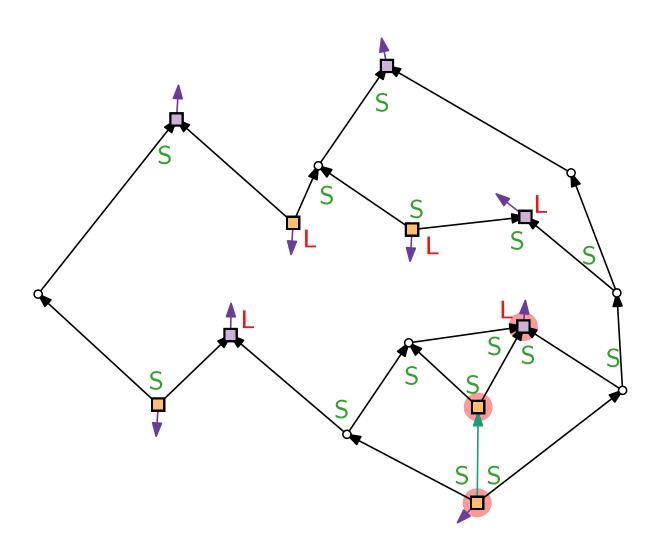

- $\blacksquare$  Refine all faces.  $\Rightarrow$  G is contained in a planar st-digraph.
- Planarity, acyclicity, bimodality are invariants under construction.

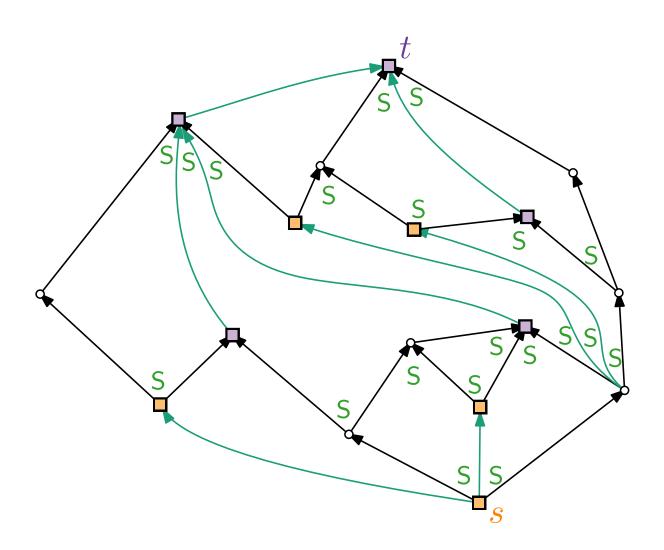

# Refinement Example

# Refinement Example

# Refinement Example

## Result Upward Planarity Test

#### Theorem 2.

[Bertolazzi et al., 1994]

For a combinatorially embedded planar digraph G it can be tested in  $\mathcal{O}(n^2)$  time whether it is upward planar.

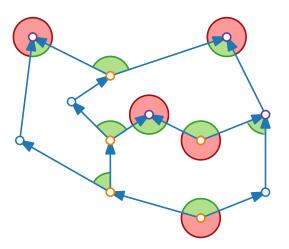

#### Proof.

- Test for bimodality.
- **Test** for a consistent assignment Φ (via flow network).
- $\blacksquare$  If G bimodal and  $\Phi$  exists, refine G to plane st-digraph H.
- lacksquare Draw H upward planar.
- Deleted edges added in refinement step.

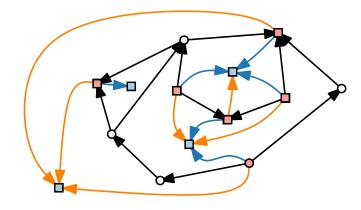

# Visualization of Graphs

# Lecture 6: Upward Planar Drawings

Part V:

Finding a Consistent Assignment

Jonathan Klawitter

# Finding a Consistent Assignment

#### Idea.

Flow (v, f) = 1 from global source / sink v to the incident face f its large angle gets assigned to.

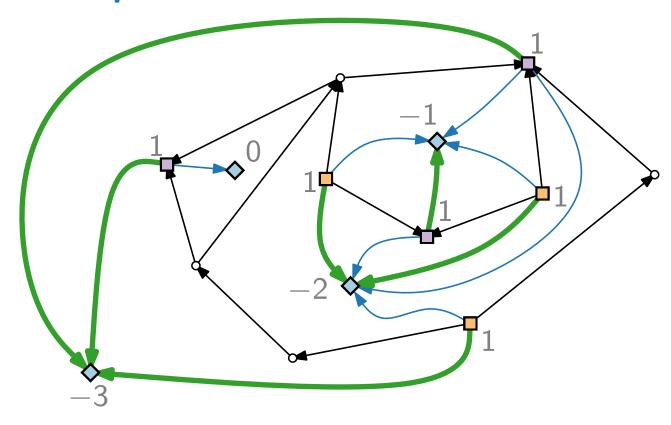

#### Flow network.

$$N_{F,f_0}(G) = ((W, E'); b; \ell; u)$$

- $W = \{v \in V \mid v \text{ source or sink}\} \cup F$   $E' = \{(v, f) \mid v \text{ incident to } f\}$
- $\ell(e) = 0 \ \forall e \in E'$
- $u(e) = 1 \ \forall e \in E'$

$$b(w) = \begin{cases} 1 & \forall w \in W \cap V \\ -(A(w) - 1) & \forall w \in F \setminus \{f_0\} \\ -(A(w) + 1) & w = f_0 \end{cases}$$

#### Example.

#### Discussion

There exist fixed-parameter tractable algorithms to test upward planarity of general digraphs with the parameter being the number of triconnected components.

[Healy, Lynch 2005, Didimo et al. 2009]

- Finding assignment in Theorem 2 can be sped up to  $\mathcal{O}(n+r^{1.5})$  where r=# sources / sinks. [Abbasi, Healy, Rextin 2010]
- Many related concepts have been studied: quasi-planarity, upward drawings of mixed graphs, upward planarity on cyclinder/torus, ...
